

**IN THE SPECIFICATION:**

Please amend the Specification as follows.

Please replace paragraph [0006] with the following paragraph.

[0006] Various standards have been proposed and are being used. One example of such a system is the GSM (Global System for Mobile communications) which uses a principle of time division multiple access to allow multiple users access to the system. The so-called third generation (3G) systems use code division multiple access in order to distinguish users. One example of such a system is the UMTS (Universal Mobile Telecommunication System) standard.

Please replace paragraph [0008] with the following paragraph.

[0008] The call admission control (CAC) is responsible for admission control of the transport network. In other words, the call admission control checks if there are resources available for the call in the radio access network. These resources are not radio resources but are usually wired connections between for example the base transceiver station and the base transceiver station controller (the Iub interface).
